

As a minimum, CR teams should generally include the following ‘core’ personnel:

- Constructability Coordinator
- Area (Resident) Construction Engineer, or designee
- Construction Project Manager
- Design Lead
- Environmental Coordinator

Composition of the remaining members of the CR team will depend on the type, size, and complexity of the project. For example, projects that contain numerous and complex issues of design and construction may require input from multiple project disciplines, whereas only a selected number of disciplines may be needed for smaller and less complex projects.

It should also be noted that participation by review team members may vary with each successive review. The invitation of specific members to a particular meeting will be largely driven by the nature of the issues expected to be discussed at that meeting. As a project’s design/construction evolves, some original team members may no longer be required or, conversely, additional subject matter experts may need to be included.
